

It seems like we are always hearing something about genetics these days. You may have heard about genomic testing for targeted cancer therapies, whole genome testing, genetic nutrition tests, or direct to consumer tests for ancestry or health indications.

How do you sort through the hype and get down to what matters? Some of these tests may be tremendously powerful, others may be the modern version of snake oil. Genetic Support Foundation will be a resource for you - to translate the science and help you understand what it means for you.

We are currently in the process of developing our personalized genomics content. As we develop our content we would love to hear from you. What topics are weighing most on your mind? [Contact us](#) and let us know; we would love to hear from you!
